

Design of a Passive Thermal Switch with Coupled Bi-material Triangles

Diego Barrutia

August 7th, 2021

Historical Background

- **Planetary Exploration Mission** need to maintain rover's elements in their operational temperatures
- **Waste Heat Scavenging Technology** to redirect heat into thermoelectric generators and convert heat to electricity
- **Cold locations** uses thermosyphons to prevent permafrost from melting and stabilize buildings

Types of Thermal Switch

- There exist two type of thermal switch - **active** and **passive**
- A passive switch behaves **both** as a thermal insulator and conductor

Design of a Passive Thermal Switch

- Thermal Properties: **thermal conductivity** of the constituent materials directly influences
- Thermomechanical Properties: **contact mechanism** is possible with smart adaptations

2. Wei K, Chen H, Pei Y, Fang D. Planar lattices with tailorable coefficient of thermal expansion and high stiffness based on dual-material triangle unit. *Journal of the mechanics and physics of solids*. 2016.

Thermal Expansion of Bi-Material Triangle

The **coefficient of thermal expansion** comes from the expansion of both crossed and base members

- The following equation gives the effective coefficient of thermal expansion:

$$\alpha_E = \alpha_c \cos(\theta)^2 [1 - (\alpha_b / \alpha_c) \sin(\theta)^2]$$

Where:

α_E = total bi-material triangle coefficient of thermal expansion

α_c = crossed member coefficient of thermal expansion

θ = half angle between the crossed members

α_b = base member coefficient of thermal expansion

Bi-Material Triangle CTE

$$\alpha_E = \alpha_c \cos(\theta)^2 [1 - (\alpha_b/\alpha_c) \sin(\theta)^2]$$

From the graph below, we can observe how α_E relies from α_b/α_c and θ :

- The more difference in α_c and α_b , the more drastic in α_E
- The smaller the angle θ in between, the more in changes in height

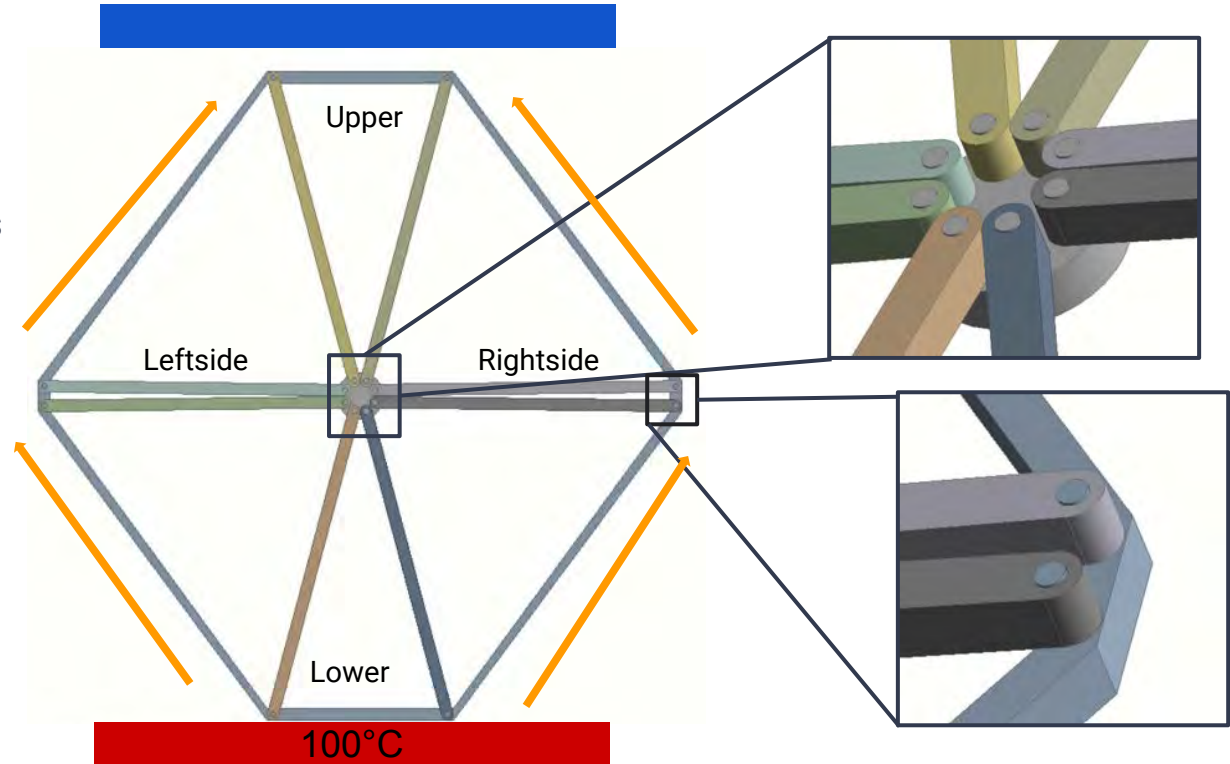

$$\frac{\text{Base}}{\text{Cross}} = \frac{\text{Aluminum}}{\text{Invar}} = \frac{24 \mu\text{m/m}\cdot\text{K}}{1.2 \mu\text{m/m}\cdot\text{K}} = 20$$

Geometrical Modeling of Bi-Material Triangle

Modeling Statistics:

- 10 Bodies
 - 8 crossed members
 - 1 external member
 - 1 connector
- 117 Faces

Thermal Expansion with Increase in Temperature

Medium Coefficient of Thermal Expansion

Copper Tungsten $7 \mu\text{m/m}\cdot\text{K}$
High Thermal Conductivity

Low Coefficient of Thermal Expansion

Silica $.55 \mu\text{m/m}\cdot\text{K}$
Low Thermal Conductivity

High Coefficient of Thermal Expansion

Aluminium $24 \mu\text{m/m}\cdot\text{K}$
High Thermal Conductivity

Thermal and Thermomechanical Performance

In contrast with uni-material triangle, bi-material triangle has a **27.84%** increase in thermal deformation

Design Improvements and Future Applications

- Improve **angle movement** and **adaptation** in the triangle members by using softer materials
 - Nanoengineered composite polymers achieve high flexibility and high thermal conductivity (2021).
- Implement round corners to allow **stress** to move more freely throughout the structures
- Introduce impurities in the outer shell part to become more **malleable** especially in the corners of triangles.
- Fine coating technology to achieve thermal control in flat surfaces
- Redirect heat using smart placement with their small size
